

Entire Data Lifecycle @Google Cloud

Google Cloud / Partner Engineer 김현정

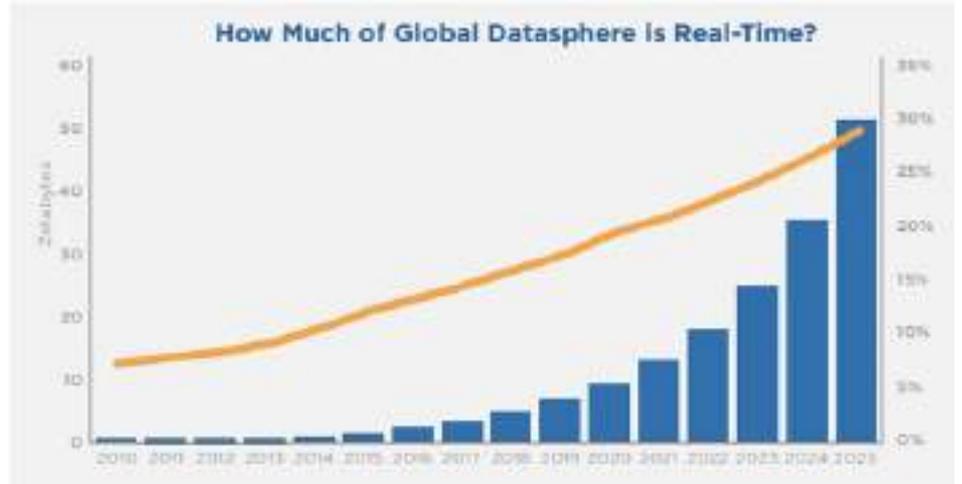

By 2025, more than a quarter of data created in the global datasphere will be real time in nature

Challenges with Big Data Projects

빅데이터는 *Big Problems*?!

1 복잡하고 어려운 시스템
유지/관리

2 다양한 데이터 소스 수집/저장

3 급속 성장하는 데이터량

4 보유 데이터에 대한
가치발굴

5 데이터 수집부터
의사결정까지의 소요시간

6 빅데이터의 통합/혁신 방안
마련

7 관련 조직간의 협업

8 데이터 보안 유지

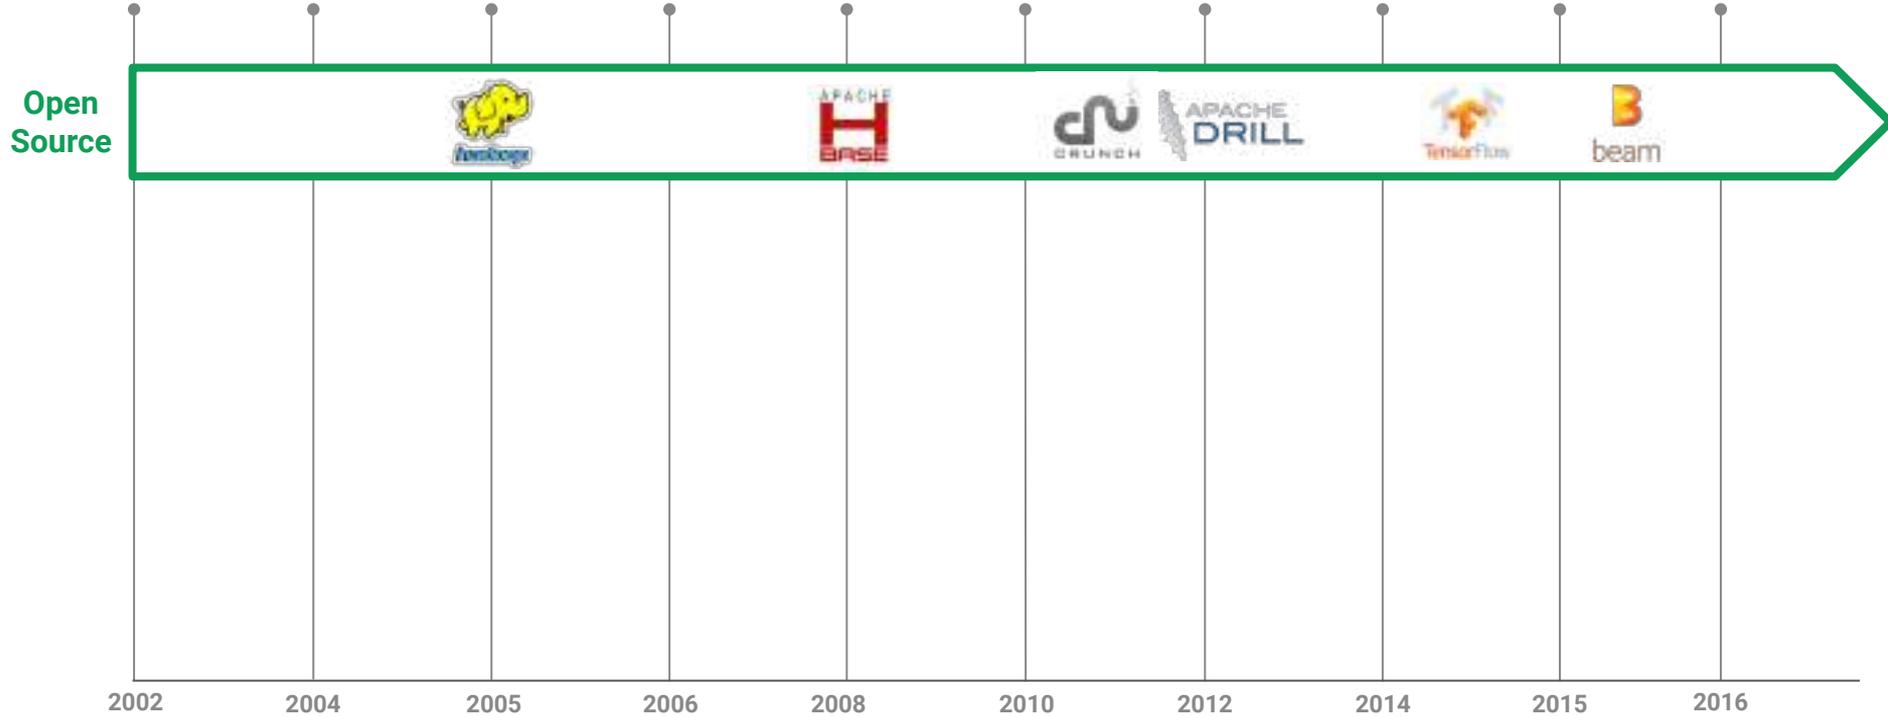

9 시스템 안정성 유지

Google faced many of those challenges

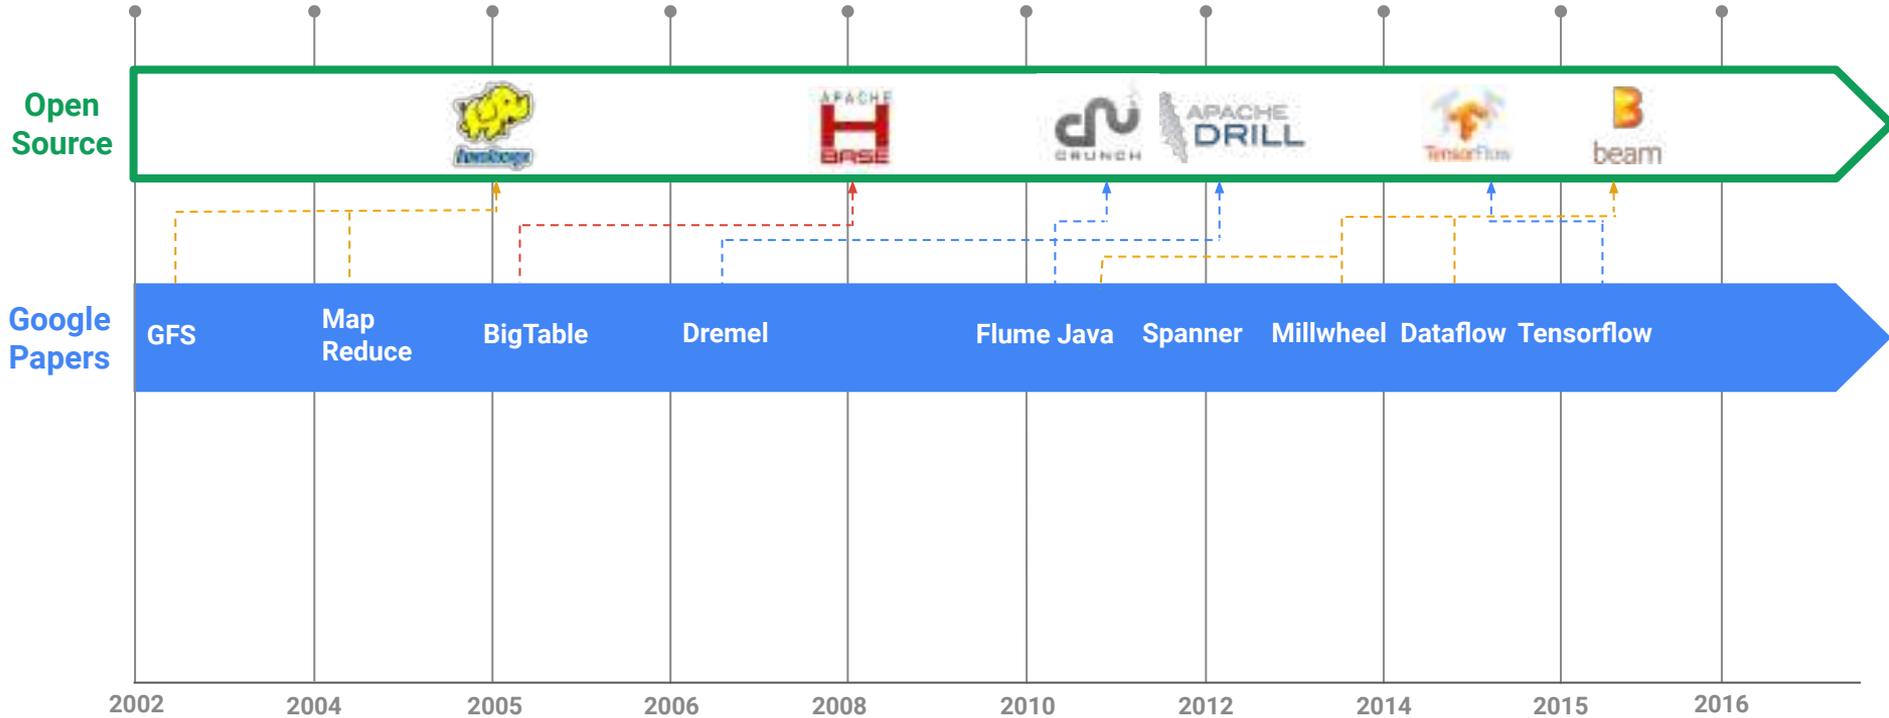

구글은 이러한 고민을 어떻게 해결했을까요?

Google BigQuery

BigQuery만의 차별점

Fully managed and **Serverless**
for maximum agility and scale

High-speed, in-memory
BI Engine for faster reporting and analysis

Built-in **ML** for out-of-the-box
predictive insights

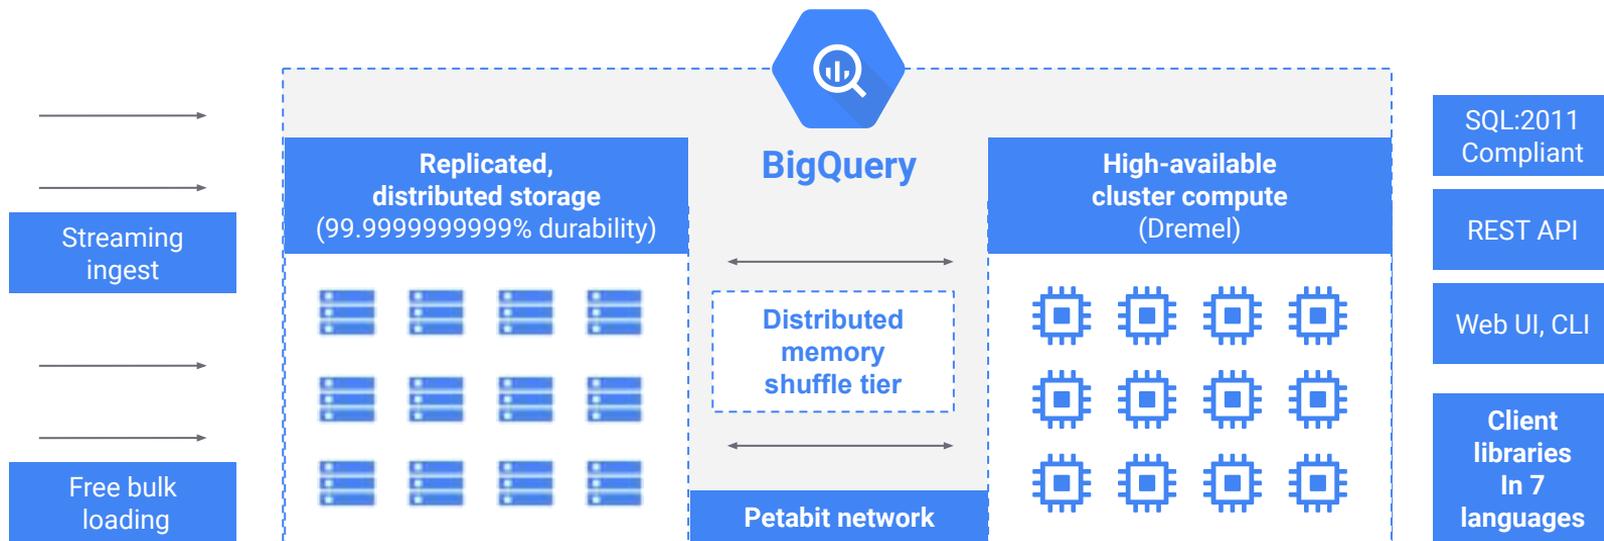

Petabyte-scale storage and

BigQuery ML for predictive analytics

ML 모델 생성 및 사전예측 분석
지원

1

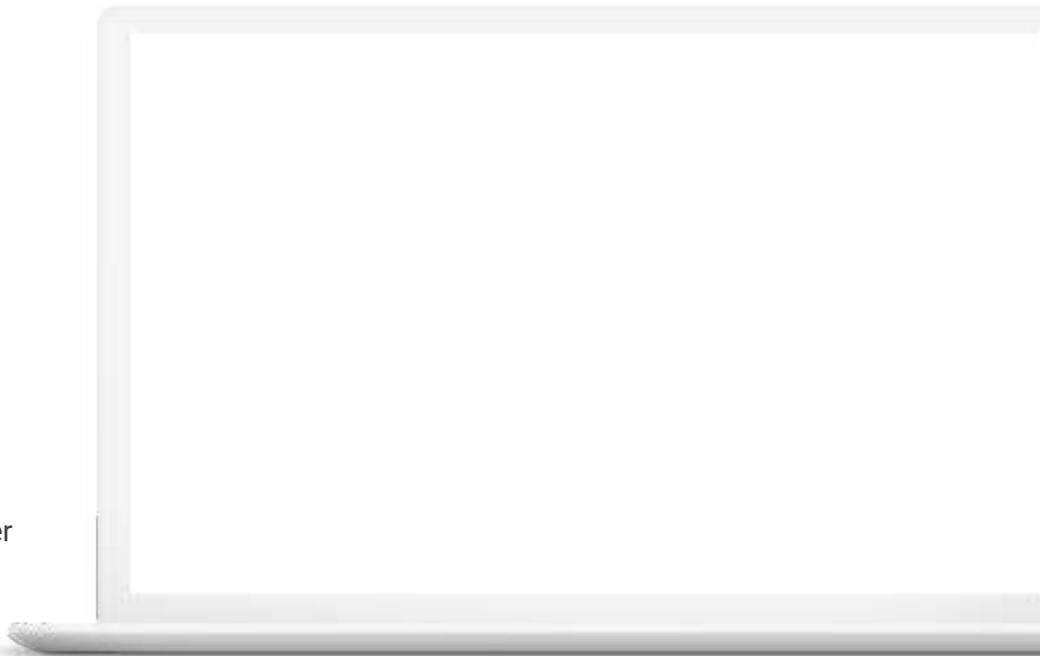

Execute ML initiatives without moving data from BigQuery

2

Iterate on models in SQL in BigQuery to increase development speed

3

Automate common ML tasks, and hyperparameter tuning

Analyze GIS data in BigQuery with familiar SQL

GIS 데이터 분석 지원

Accurate spatial analyses with
Geography data type over **GeoJSON**
and **WKT** formats

Support for core **GIS functions** –
measurements, transforms,
constructors, etc... – **using familiar SQL**

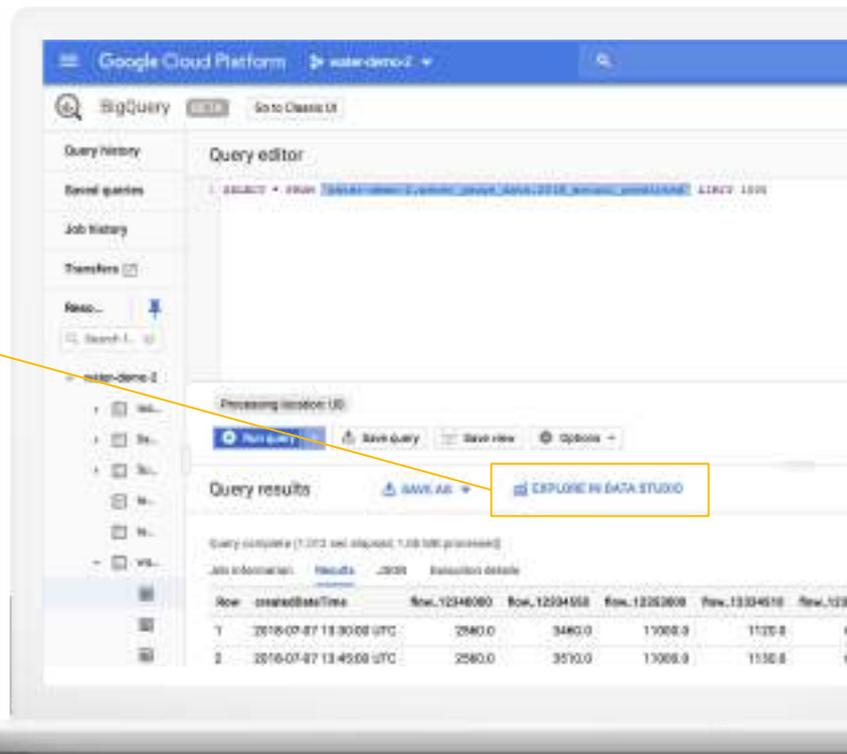

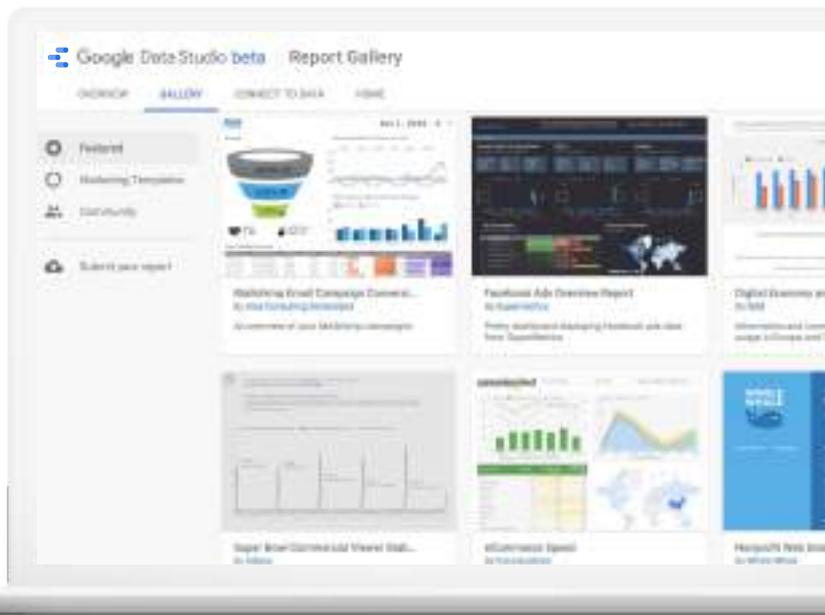

Visualize to identify patterns using Data Studio

Data Studio 로 분석 결과 시각화

See your BigQuery data in one click with Data Studio Explorer

원클릭 BigQuery 분석 결과 리포팅

Cloud Pub/Sub Scalable Event Ingestion and Delivery

확장 가능한 글로벌 이벤트 처리 서비스

Global, fully-managed event delivery

Ingest millions of events per second

Integrated with **Cloud Dataflow for stream processing**

Streaming Inserts to BigQuery

Cloud Dataflow managed data processing service

스트리밍 & 배치 데이터 ETL 파이프라인 프로세싱

Managed service for **parallel processing** (e.g. ETL) of large data sets in Google Cloud

Supports both **Streaming and Batch** processing (no need for separate pipeline code development)

Autoscales up and down based on processing load

A screenshot of the Google Cloud Platform console showing a Dataflow job. The main area displays a pipeline diagram with five 'PMagTransform' nodes. The top node is 'PTTableLoadTransform0' (59 sec), followed by 'PMagTransform' (8 sec) and 'PMagTransform2' (3 sec). These three nodes feed into two parallel nodes: 'PMagTransform4' (32 sec) and 'PMagTransform5' (8 sec). The right sidebar shows a 'Summary' panel with job details: Job Name 'cloud-dataprep-dcm-wrangle2-\$16-by-kartik-trasi', Job ID '20170901_28_33_18-792349617056583397', Job Status 'Running (Stop job)', Job Type 'Batch', and Elapsed Time '8 min 47 sec'. Below the pipeline is a 'Job Logs' section with a table of log entries.
